1. Creating app in react

```
C:\My WorkSpace\Bootcamp\react 5-3-25\react>npx create-react-app bootcamp-app
Need to install the following packages:
create-react-app@5.1.0
Ok to proceed? (y) y
```

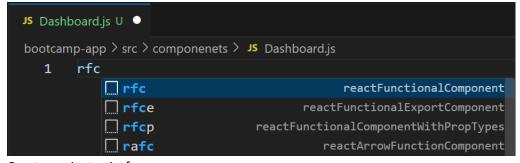

- 2. Install required packages
  - a. C:\My WorkSpace\Bootcamp\react 5-3-25\react>cd bootcamp-app
  - b. C:\My WorkSpace\Bootcamp\react 5-3-25\react\bootcamp-app>npm i react-router-dom
  - c. C:\My WorkSpace\Bootcamp\react 5-3-25\react\bootcamp-app>npm i bootstrap@5.3.3
- 3. Run project
  - a. C:\My WorkSpace\Bootcamp\react 5-3-25\react\bootcamp-app>npm start
- 4. Open project in vs code and delete all files inside src excluding index.js

5. Make index.js look like

- 6. Create all required components in react application
- 7. Create code for all component using rfc

- 8. Create project wireframe
- 9. According to wireframe add components

10. Add bootstraps css and js reference inside index.js file

```
bootcamp-app > src > Js index.js > ...
    import React from 'react';
    import ReactDOM from 'react-dom/client';
    import Dashboard from './componenets/Dashboard';
    import '../node_modules/bootstrap/dist/css/bootstrap.min.css'
    import '../node_modules/bootstrap/dist/js/bootstrap.min.js'
```

# 11. Code for navbar

- a. Copy navbar code from bootstrap and add inside Navbar.js
- b. You might get errors just close the tags like hr, input etc and change class to className
- c. Code

```
import React from 'react'
export default function Navbar() {
 return (
   <div>
     <nav className="navbar navbar-expand-lg bg-body-tertiary" data-bs-</pre>
theme="dark">
       <div className="container-fluid">
         <a className="navbar-brand" href="#">Navbar</a>
         <button className="navbar-toggler" type="button" data-bs-</pre>
toggle="collapse" data-bs-target="#navbarSupportedContent" aria-
controls="navbarSupportedContent" aria-expanded="false" aria-label="Toggle"
navigation">
          <span className="navbar-toggler-icon"></span>
         </button>
         <div className="collapse navbar-collapse" id="navbarSupportedContent">
           <a className="nav-link active" aria-current="page"</pre>
href="#">Home</a>
            <a className="nav-link active" aria-current="page"</pre>
href="#">Contact</a>
            <a className="nav-link active" aria-current="page"</pre>
href="#">Products</a>
```

### d. Output

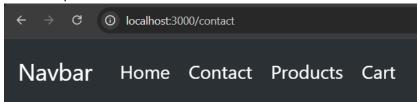

# 12. Implementing routing

a. Create routes array inside index.js using createBrowserRouter

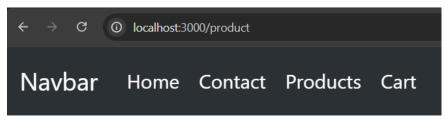

b. Add above routes array on RouterProvider as -

c. Add <Outlet/> below Navbar inside Dashboard.js to render components dynamically

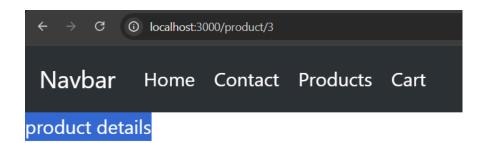

d. Check output

contact us

all products

#### 13. Implementing routing inside navbar

a. Instead of a tag, we will use Link tag to add routing as -

```
JS Navbar.js U X
bootcamp-app > src > componenets > JS Navbar.js > ♦ Navbar
     export default function Navbar() {
          <nav className="navbar navbar-expand-lg bg-body-tertiary" data-bs-theme="dark">
            <div className="container-fluid">
             <<Link className="navbar-brand" to={'/'}>Navbar</Link>
  8
              <button className="navbar-toggler" type="button" data-bs-toggle="collapse" data-bs-target="#nav</pre>
               <span className="navbar-toggler-icon"></span>
              <div className="collapse navbar-collapse" id="navbarSupportedContent">
               <Link className="nav-link active" aria-current="page" to={'/'}>Home</Link>
                 <Link className="nav-link active" aria-current="page" to={'/contact'}>Contact</Link>
                 <Link className="nav-link active" aria-current="page" to={'/product'}>Products</Link>
                  <Link className="nav-link active" aria-current="page" to={'/'}>Cart</Link>
```

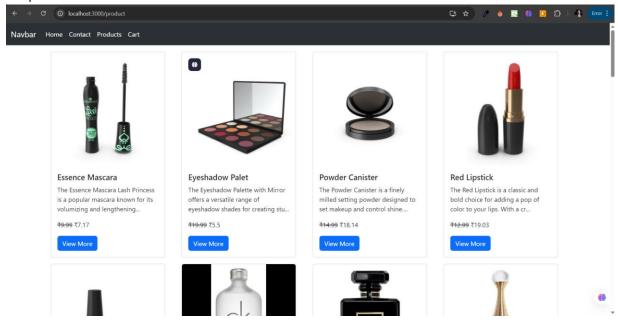

- b. DONE!!
- c. Go to navbar and click and check whether components are rendering
- 14. Create card inside Product.js

Product.js

- 15. Fetching products data from api https://dummyjson.com/products and displaying into Product.js component
  - a. Hook in react are nothing but built in functions of react
  - b. What is useState() hook?
    When state(default value) of variable changes, we want to render component again, here useState() help us to do that!
  - c. Code for Product.js to display all products in card using fetch api

```
import React, { use, useEffect, useState } from 'react'
// const products = [{name:'mobile',price:200},{name:'laptop',price:600}]
export default function Product() {
  //let products = [{name:'mobile',price:200},{name:'laptop',price:600}]
  //let[variableToStoreDefaultvalue, functionToUpdateVariable]=useState(default state/value)
 let[products, setProducts ]=useState(null)
  //let [counter, setCounter]=useState(0)
 async function fetchProucts()
   let response=await fetch("https://dummyjson.com/products",{method:'GET'})
   let data=await response.json()
   console.log(data);
   console.log(data.products);
   //products = data.products
   setProducts(data.products)
  //fetchProucts()
      fetchProucts()
 useEffect(()=>{
   fetchProucts()
  },[])
 return (
   <div className='container mt-3'>
     {/* {counter}
     <button onClick={()=>{setCounter(counter+1)}}>change counter</button> */}
     <div className='row'>
         products && products.map(product => {
           return (
             <div className='col-3 mb-3' key={product.id}>
                 <div className="card" style={{width:18+"rem"}}>
                     <img src={product.thumbnail} className="card-img-top" alt="..."/>
                     <div className="card-body">
                       <h5 className="card-title">{product.title.slice(0,15)}</h5>
                       {product.description.slice(0,95)}...
                      {product.category}
                      <del>&#8377;{product.price}</del> &#8377;{product.discountPercentag
                       <a href="#" className="btn btn-primary">View More</a>
                     </div>
                   </div>
               </div>
         })
     </div>
   </div>
```

d. Output

e.

- 16. Parameterise routing
  - a. Here we have to display details of particular product when we click on View more button
  - b. Add link to view more button

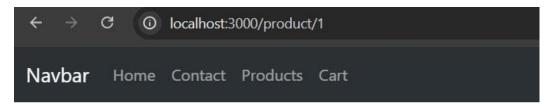

c. Code inside ProductDetails.js to fetch product from its id and also implementing back button

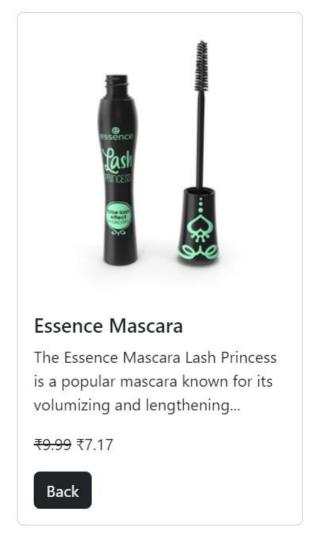

```
import React, { useEffect, useState } from 'react'
import { Link, useNavigate, useParams } from 'react-router-dom'

export default function ProductDetails() {
    let urlParams=useParams()
    let navigate=useNavigate()
    console.log(urlParams);
    console.log(urlParams.id);
    let id = urlParams.id
    let[product, setProduct]=useState(null)
    async function fetchProuctById()
    {
        let response=await fetch(`https://dummyjson.com/products/${id}`,{method:'GET'})
        let data=await response.json()
        console.log(data);
        setProduct(data)
    }
    useEffect(()=>{fetchProuctById()},[])
```

```
return (
   product &&
   <div className='container mt-3'>
       <div className='row'>
           <div className='col-3 mb-3' key={product.id}>
                 <div className="card" style={{width:18+"rem"}}>
                     <img src={product.thumbnail} className="card-img-top" alt="..."/>
                     <div className="card-body">
                       <h5 className="card-title">{product.title.slice(0,15)}</h5>
                       {product.description.slice(0,95)}...
                       <del>&#8377;{product.price}</del> &#8377;{product.discountPercentag
e}
                      <button className='btn btn-dark text-light'</pre>
onClick={()=>{navigate('/product')}}>Back</button>
                     </div>
                 </div>
             </div>
       </div>
   </div>
```

d. Output

17. Create useState to manage state of filtered products (in Product.js)

```
JS Product.js X
src > componenets > JS Product.js > ♦ Product
      import React, { use, useEffect, useState } from 'react'
      import { Link } from 'react-router-dom';
      import FilterProduct from './FilterProduct';
      import SortProduct from './SortProduct';
      // const products = [{name:'mobile',price:200},{name:'laptop',price:600}]
      export default function Product() {

√ let[products, setProducts ]=useState(null)
       let[filteredProducts,setFilteredProducts] = useState(null)
 10
        async function fetchProucts()
          let response=await fetch("https://dummyjson.com/products",{method:'GET'})
          let data=await response.json()
          console.log(data);
          console.log(data.products);
          setProducts(data.products)
         setFilteredProducts(data.products) //here filteredProducts have all products
```

- 18. Filter by product category functionality
  - a. Create file FilterProduct.js → create component using rfc
  - b. Create filterProductByCategory() function inside Product.js

c. Pass above function to FilterProduct component as -

d. Final code for FilterProduct component -

```
import React, { useEffect, useState } from 'react'

export default function FilterProduct(props) {
   let [categories, setCategories]=useState(null)
   async function fetchAllCategories()
```

```
let response =await fetch("https://dummyjson.com/products/categories")
       let data= await response.json()
       setCategories(data)
   useEffect(()=>{fetchAllCategories()},[])
return (
   <div className='mb-3'>
       <div className="dropdown">
           <button className="btn btn-secondary dropdown-toggle" type="button" data-bs-</pre>
toggle="dropdown" aria-expanded="false">
               Select Category
           <button className='btn'</li>
onClick={()=>{props.onFilterProductByCategory("all")}}>All</button> 
                  categories && categories.map(category => {
                          <button className='btn'</li>
onClick={()=>{props.onFilterProductByCategory(category.name)}}>{category.name}</button>
})
       </div>
   </div>
```

- e. DONE !!!!
- 19. Sort product functionality
  - a. Create SortProduct.js file → create component using rfc
  - b. Create sortProductByPrice() function inside Product.js

```
function sortProductByPrice(sortingType)
{
  let data = [...filteredProducts];
  if(sortingType==='asc')
  {
     data.sort((obj1, obj2)=> obj1.price-obj2.price)
  }
  else
  {
     data.sort((obj1, obj2)=> obj2.price-obj1.price)
  }
  setFilteredProducts(data)
}
```

c. Render above component inside Product.js

d. Final code for SortProduct component

e. DONE!!!

#### 20. Handling form in react

We are going to use library – React Hook Form to handle form in react

```
C:\My WorkSpace\Bootcamp\react 5-3-25\react\bootcamp-app>npm install react-hook-form
```

There are 3 important things in form that we have to manage -

Individual field with its data, entire form data, and errors on each field

- a. Install RHF as npm install react-hook-form
- b. Code for Contact.js

```
import React from 'react'
import { useForm } from 'react-hook-form'
export default function Contact() {
  let {register, handleSubmit, formState}=useForm()
  function collectFormData(formData)
   console.log(formData);
    <div className='container d-flex justify-content-center mt-3 border border-3 p-5'>
     <form className='w-50' onSubmit={handleSubmit(collectFormData)}>
       <div className="mb-3">
          <label htmlFor="username" className="form-label">User Name:</label>
         <input type="text" className="form-control" id="username"</pre>
          {...register('username', {required:true, minLength:4, maxLength:10})}/>
       </div>
       {formState.errors && formState.errors.username &&
formState.errors.username.type=='required' && 'UserName is required'}
          {formState.errors && formState.errors.username &&
formState.errors.username.type=='minLength' && 'min 4 characters required in username'}
         {formState.errors && formState.errors.username &&
formState.errors.username.type=='maxLength' && 'max 10 characters required in username'}
       <div className="mb-3">
         <label htmlFor="userage" className="form-label">User Age:</label>
         <input type="number" className="form-control" id="userage"</pre>
         {...register('userage', {required:true, min:18, max:80})}/>
        </div>
        {formState.errors && formState.errors.userage &&
formState.errors.userage.type=='required' && 'UserAge is required'}
         {formState.errors && formState.errors.userage &&
formState.errors.userage.type=='min' && 'min age 18 required'}
         {formState.errors && formState.errors.userage &&
formState.errors.userage.type=='max' && 'max age 80 required'}
       <button type="submit" className="btn btn-primary">Submit</button>
     </form>
   </div>
```

### c. DONE!

21. Implementing search functionality
 data.filter(name => {return name.toLowerCase().includes('A'.toLowerCase())})

- a. Create SearchProduct.js file → create component using rfc
- b. Create function searchProductByName() in Product.js

```
function searchProductByName(productName)
{
   let data = [...filteredProducts];
   let newdata = data.filter(product => {return
product.title.toLowerCase().includes(productName.toLowerCase())})
   setFilteredProducts(newdata)
}
```

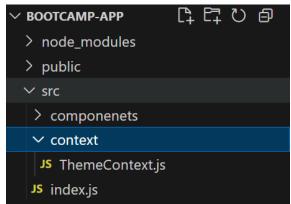

c. Render SearchProduct component in Product.js

d. Code for SearchProduct.js

```
import React from 'react'
import { useForm } from 'react-hook-form';
export default function SearchProduct(props) {
    let {register, handleSubmit, formState}=useForm()
      function collectFormData(formData)
        console.log(formData);
        props.onSearchProductByName(formData.productName)
  return (
      <form className='d-flex' onSubmit={handleSubmit(collectFormData)}>
        <div className='me-3'>
          <input type="text" className="form-control" id="productName"</pre>
          {...register('productName',{required:true,minLength:4,maxLength:10})}/>
          <span className='text-danger'>
          {formState.errors && formState.errors.productName &&
formState.errors.productName.type=='required' && 'productName is required'}
          {formState.errors && formState.errors.productName &&
formState.errors.productName.type=='minLength' && 'min 4 characters required in productName'}
          {formState.errors && formState.errors.productName &&
formState.errors.productName.type=='maxLength' && 'max 10 characters required in productName'}
        </span>
        </div>
        <button type="submit" className="btn btn-primary">Search</button>
      </form>
    </div>
```

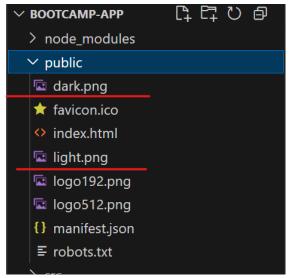

#### 22. Context

a. Create context folder inside src → create ThemeContext.js in it

b. In index.js, wrap <Dashboard/> inside ThemeProvider as -

c. Add 2 png images (for dark and light inside public folder)

d. Get context value in navbar display above images according to theme

e. Access themeStyle in contact.js and Product.js as –

```
src > componenets > JS Contactjs > ۞ Contact

import React, { useContext } from 'react'

import { useForm } from 'react-hook-form'

import { ThemeContext } from '../context/ThemeContext';

export default function Contact() {

//accessing context |

let {themeStyle}=useContext(ThemeContext)

let {register, handleSubmit, formState}=useForm()

function collectFormData(formData)

{

console.log(formData);

}

return (

<div className='container d-flex justify-content-center mt-3 border border-3 p-5' style={themeStyle}>

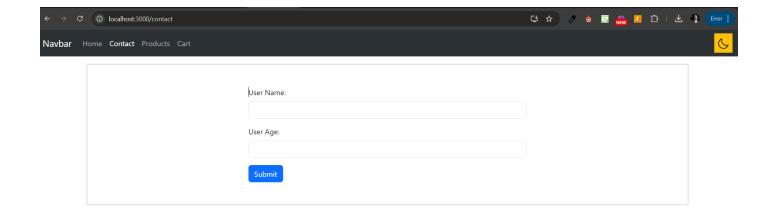

</form className='w-50' onSubmit={handleSubmit(collectFormData)}>...

</form </form>

</form className='w-50' onSubmit={handleSubmit(collectFormData)}>...
```

```
JS Product.js X
  src > componenets > JS Product.js > ♦ Product
          export default function Product() {
             //accessing context - context code start
    16
             let {themeStyle}=useContext(ThemeContext)
            async function fetchProucts()...
            //fetchProucts()
            // useEffect(()=>{
            // fetchProucts()
            useEffect(()=>{ ···
            },[])
            // async function filterProductByCategory(url) ...
            function filterProductByCategory(categoryName) ···
            // async function sortProductByPrice(url) ...
            function sortProductByPrice(sortingType) ...
            function searchProductByName(productName) ...
            return (
              <div className='container mt-3 p-3' style={themeStyle}>
                <div className='d-flex justify-content-between'>
                <FilterProduct onFilterProductByCategory={filterProductByCategory}/>
                <SortProduct onSortProductByPrice={sortProductByPrice}/>
    C O localhost:3000/contact
                                                                   단 ☆ // 👂 🖪 🔐 📘 🖸 | 🛧 🏰 (Error :
Navbar Home Contact Products Cart
```

f. DONE !!! 23. THANK YOU -

ALL THE BEST – TEJAS SIR!
